

Elastic Potential Energy

IB PHYSICS | ENERGY & MOMENTUM

Calculating from a Graph

Graph of Force vs Displacement

Work of a Varying Force

Our definition of work applies only for a constant force or an average force.

$$W = Fs \cos\theta$$

What if the force varies with displacement as with stretching a spring or rubber band?

What about a Varying Force?

Work to PEe Lab

Spring Number
1

You want to stretch and record your data for a total of at least 5 trials.

If any of your trials give the same stretch as a previous trial, don't record that run, but reset and try stretching it again.

Work of a Varying Force

How can you calculate the work?

Work of a Varying Force

What **work** is required to stretch this spring from $x = 0$ to $x = 6$ m?

Elastic Potential Energy

As the pull back distance increases elastic potential energy _____

Hooke's Law

When a spring is stretched, there is a restoring force that is proportional to the displacement.

Try this...

A block with a mass of 2 kg is suspended from a spring and produces the displacement shown. What is the spring constant?

$$F = k\Delta x$$

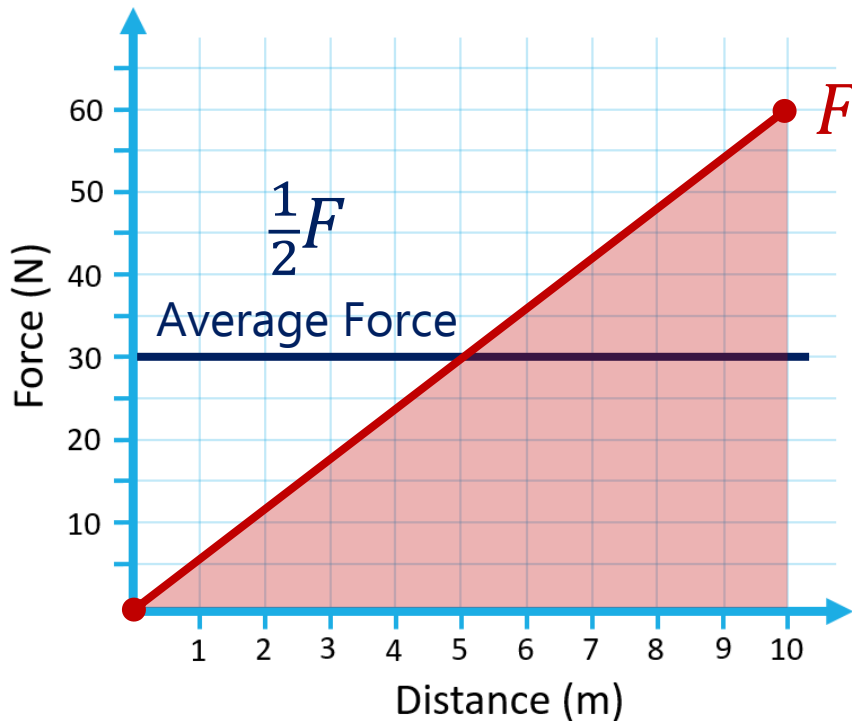

Work and Energy

Work done on a system causes the system to gain or lose energy

Work of a Varying Force

Now that we know that $F = k\Delta x$, we can calculate the stored elastic potential energy with the work equation

$$Work = Fs$$

Elastic Force and Work

$$F = k\Delta x$$

$$E_p = \frac{1}{2}k\Delta x^2$$

**The spring constant k is a property of the spring*

Data Booklet

Sub-topic 2.3 – Work, energy and power

$$W = Fs \cos\theta$$

$$E_K = \frac{1}{2}mv^2$$

$$E_P = \frac{1}{2}k\Delta x^2$$

$$\Delta E_P = mg\Delta h$$

$$\text{power} = Fv$$

$$\begin{aligned}\text{Efficiency} &= \frac{\text{useful work out}}{\text{total work in}} \\ &= \frac{\text{useful power out}}{\text{total power in}}\end{aligned}$$

Conservation of Energy

How far up the 15° incline of a pinball table will a 0.1 kg pinball move after it is launched? The spring constant is 100 N/m and is compressed by 0.08 m .

Try this...

What **work** is required to stretch this spring ($k = 200 \text{ N m}^{-1}$) from $\Delta x = 0.1 \text{ m}$ to $\Delta x = 0.4 \text{ m}$?

Try this...

What **work** is required to stretch this spring ($k = 200 \text{ N m}^{-1}$) from $\Delta x = 0.1 \text{ m}$ to $\Delta x = 0.4 \text{ m}$?

Why not just use the stretch change?

$$\frac{1}{2}k\Delta x^2 = \frac{1}{2}(200)(0.3)^2 = 9 \text{ J}$$

Example IB Question

An increasing force acts on a metal wire and the wire extends from an initial length l_0 to a new length l . The graph shows the variation of force with length for the wire. The energy required to extend the wire from l_0 to l is E . The wire then contracts to half its original extension. What is the work done by the wire as it contracts?

- A. $0.25E$
- B. $0.50E$
- C. $0.75E$
- D. E

Lesson Takeaways

- ☐ I can calculate work as area bounded by a Force vs Distance graph
- ☐ I can use Hooke's Law to calculate the elastic force at a given displacement
- ☐ I can describe and calculate elastic potential energy
